aluminum**

Beauty & Elegance

The Beauty of Natural Wood

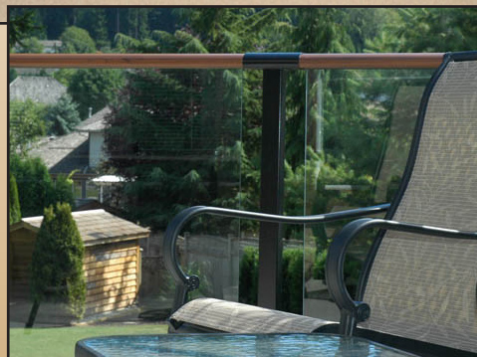

Aluminum railings have earned a reputation for strength and durability. Some people prefer the appearance of real wood railings and choose yearly maintenance and a shorter lifespan over the durability of powder coated aluminum. Savierra is proud to offer a perfect combination of the two. New powder coating technology now allows for stunning woodgrain prints to be set into aluminum railings. Whether it is the top and bottom rail in a glass system, or the individual pickets, the beauty of wood can now be enjoyed maintenance-free for years. Savierra presently offers the system in traditional black or white, and in custom colors.

Create a sophisticated focal point for your deck! Inspired by the railings seen on luxury yachts and cruise ships, the oversized handrails accentuate the overall quality of workmanship in the design. The result is a railing that not only acts as a protective barrier, but one that defines and beautifies your home.

The Strength and Durability of Aluminum

One of the key features of a quality aluminum structure lies in the tensile strength and thickness of the extrusions. Savierra ensures that only high grade alloys are used in the manufacturing of this railing system. It has been tested to meet the most stringent national and international building codes. The result is a railing guaranteed to last well over a generation.
